Abstracts

According to our (Global Info Research) latest study, the global Quinine Hydrochloride market size was valued at US\$ 370 million in 2025 and is forecast to a readjusted size of US\$ 466 million by 2032 with a CAGR of 3.3% during review period.

In 2025, global Quinine Hydrochloride output reached about 1.2 billion dosage units and global capacity of around 1.4 billion dosage units. The average price is about USD 0.30 per dosage unit, with gross margins near 45%. Quinine Hydrochloride is a hydrochloride salt form of quinine, a naturally occurring cinchona alkaloid extracted primarily from the bark of Cinchona tree species. It is widely used as an active pharmaceutical ingredient (API) for the treatment of malaria caused by Plasmodium falciparum, particularly in severe or drug-resistant cases, and is also utilized in pharmaceutical research and certain specialty formulations. Compared with quinine sulfate, quinine hydrochloride offers higher water solubility, making it suitable for injectable and liquid dosage forms. The supply chain begins with the cultivation and harvesting of Cinchona trees, mainly in countries such as the Democratic Republic of the Congo, Indonesia, India, and Peru, followed by bark processing and extraction of quinine alkaloids. The extracted quinine is purified and converted into quinine hydrochloride through controlled pharmaceutical-grade chemical synthesis and crystallization processes. The API then undergoes quality testing, regulatory compliance, and packaging before being supplied to pharmaceutical manufacturers for formulation into injectable solutions, tablets, capsules, or oral liquids. Finished products are distributed through pharmaceutical wholesalers, hospitals, clinics, pharmacies, government procurement programs, and international healthcare organizations for use in malaria treatment and other approved medical applications.
