Abstracts

The global Quit Smoking App market size is expected to reach \$ 1244 million by 2032, rising at a market growth of 10.9% CAGR during the forecast period (2026-2032).

Quit smoking apps are applications that leverage mobile internet and digital health technologies to provide smoking cessation interventions and support for smokers. Their core functions include smoking behavior tracking, nicotine dependence assessment, cessation plan development, psychological and behavioral interventions, AI-powered incentive reminders, community support, and relapse warning analysis. These apps typically combine behavioral science, digital therapy, and data analytics to reduce users' tobacco dependence through personalized intervention pathways, thereby increasing the success rate of quitting smoking. Some advanced products also integrate wearable devices, AI health assistants, and data from medical institutions to achieve more precise health management and long-term behavioral changes.

The quit smoking app industry is experiencing rapid growth, primarily driven by increased global awareness of the harms of smoking, strengthened government tobacco control policies, and the widespread adoption of mobile health (mHealth) and digital therapy. With increasing smartphone penetration and the development of AI-based personalized health intervention technologies, quit smoking apps are evolving from 'simple tool applications' to 'digital treatment solutions.' In the future, the industry will further integrate deeply with the healthcare system, enhancing long-term user engagement through AI-based relapse risk prediction, optimized behavioral intervention models, and subscription-based health services. Especially among young users, mobile, gamification, and social support mechanisms will become the core growth engines, giving the market the potential for continued high-speed expansion.
