Abstracts

The global R-2R DAC market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

An R-2R type digital-to-analog converter is an electronic device that converts digital signals into analog signals. It consists of a series of resistors, one half of which has twice the resistance of the other half. These resistors are connected into a resistor network to form a binary weighted resistor. When a digital signal is applied across these resistors, the resistors produce a corresponding voltage output according to the principle of binary weighting, thereby generating an analog signal.

The advantage of the R-2R digital-to-analog converter lies in its simple structure, high speed, high precision and low cost. It is widely used in fields such as audio equipment, measurement equipment, communication equipment and control systems.

This report studies the global R-2R DAC production, demand, key manufacturers, and key regions.
