The global Rack Type Tritium Measuring Instrument market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The rack type tritium measuring instrument is a device used to measure the tritium content in various samples. Tritium is a radioactive isotope of hydrogen that releases low energy β particles, usually used in nuclear reactors, weapons and other applications. A bracket type tritium measuring instrument usually consists of a sample holder, a detector, and a data acquisition system. The sample rack is equipped with the sample to be tested, and the detector measures the tritium emission in the sample β particles. The data collection system collects and analyzes data from the detector, and calculates the tritium content in the sample. Rack mounted tritium measuring instruments are commonly used in nuclear power plants, research facilities, and other industries that use or produce tritium.
