A Radar Corner Reflector is a passive device designed to amplify radar signal returns, constructed from three mutually perpendicular metal or mesh panels that reflect electromagnetic waves directly back to the radar source. This principle is critical in marine navigation (e.g., buoys, lifeboats), aviation obstacle marking (e.g., wind turbines, towers), and military decoy applications. Made from corrosion-resistant materials like aluminum or stainless steel, some models feature collapsible designs for portability. Performance is quantified by Radar Cross-Section (RCS), with standard reflectors achieving RCS values from tens to hundreds of square meters, ensuring high detectability for low-profile targets.
