According to our latest research, the global Radar Cross Section (RCS) Measurement System market size will reach USD million in 2031, growing at a CAGR of %over the analysis period.

A Radar Cross Section (RCS) measurement system is used to determine how detectable an object is by radar, based on the amount of radar signal it reflects back to the source. This system typically involves emitting electromagnetic waves towards the object and measuring the scattered energy from different angles to evaluate its radar signature. RCS is critical for assessing the stealth characteristics of military aircraft, ships, and vehicles, as well as for designing radar systems and improving the performance of commercial radar applications. RCS measurement systems are essential in defense and aerospace industries, where minimizing an object's radar visibility is key to enhancing its survivability in hostile environments.
