According to our (Global Info Research) latest study, the global Radial Spherical Plain Bearings Requiring Maintenance market size was valued at US\$ 646 million in 2024 and is forecast to a readjusted size of USD 896 million by 2031 with a CAGR of 4.8% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Radial Spherical Plain Bearings is a special structure of sliding bearing. Its structure is simpler than that of rolling bearings. It mainly consists of an inner ring with an outer spherical surface and an outer ring with an inner spherical surface, which can withstand larger loads. Depending on its type and structure, it can withstand radial loads, axial loads, or combined loads of both radial and axial directions. It is generally used for low-speed swinging motion (i.e. angular motion). Due to the spherical sliding surface, it can also perform tilting motion (i.e. centering motion) within a certain angle range. It can still work normally when the support shaft and the shaft shell hole are not concentric. Radial Spherical Plain Bearings Requiring Maintenance are mainly composed of an inner ring with an outer spherical surface and an outer ring with an inner spherical surface. Its structure is relatively simple, but it has a large load capacity and impact resistance. In addition, oil lubricated radial joint bearings are usually equipped with lubrication grooves and oil holes to facilitate the supply and distribution of lubricants, thereby extending the service life of the bearings and improving work efficiency.
