According to our (Global Info Research) latest study, the global Radiation Dose Calibration Service market size was valued at US\$ 663 million in 2025 and is forecast to a readjusted size of US\$ 942 million by 2032 with a CAGR of 5.1% during review period.

Radiation Dose Calibration Service is a comprehensive technical activity designed to ensure the accuracy and reliability of measurement results from various radiation detection devices, traceable to national and international metrological standards. In practice, the service provider first establishes a standard radiation field, typically generated using gamma rays, X-rays, beta rays, or neutron sources. The radiation instrument under test is then placed in this standard field with a known dose rate for comparative measurement. By analyzing the difference between the instrument readings and the standard values, a calibration factor or correction coefficient is derived. The entire process adheres to internationally recognized technical specifications such as ISO/IEC 17025, and the resulting calibration certificate demonstrates the integrity of the measurement chain. This service is widely used in radiation protection monitoring at nuclear power plants, quality control of radiotherapy in hospitals, industrial non-destructive testing, and environmental radioactivity level assessment, serving as a crucial foundation for ensuring personnel safety, meeting regulatory requirements, and guaranteeing the credibility of monitoring data.
