The global Radiation Resistant Coordinate Robot market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The radiation-resistant coordinate robot is a robot system that can operate normally in a high-radiation environment. In radioactive environments such as nuclear power plants, nuclear factories, and nuclear medicine, traditional robotic systems often fail to work properly or are easily damaged due to the presence of radiation. The radiation-resistant coordinate robot can work safely and reliably in these high-radiation environments. Radiation-resistant coordinate robots usually use special materials and designs to resist the impact of radiation on the robot system. They usually have the following characteristics:

- Radiation protection:** Radiation-resistant coordinate robots adopt radiation protection materials and structural design, which can effectively reduce the impact of radiation on the robot system and protect the key components and electronic equipment of the robot.
- High temperature resistance:** In high radiation environments, the temperature may rise, and the radiation-resistant coordinate robot can withstand high temperature environments to ensure the normal operation of the robot system.
- Dustproof and waterproof:** Radiation-resistant coordinate robots usually have a dustproof and waterproof design to deal with dust, liquid and other pollutants that may exist in high-radiation environments.
- Remote operation:** In order to protect operators from radiation hazards, radiation-resistant coordinate robots usually support remote operation. Operators can stay away from high-radiation areas and operate robots through consoles or remote controls. Radiation-resistant coordinate robots are widely used in fuel processing, radiation monitoring, waste disposal and other tasks in nuclear power plants. They can replace manual operations in high-radiation environments, improve work efficiency, and ensure the safety of operators.
