A radiation temperature calibration source is a standard radiator used to calibrate infrared thermometers and thermal imagers. By simulating stable infrared radiation outputs at various temperatures, it provides measuring instruments with a known and traceable temperature reference. Typically, it employs high-emissivity materials and precision temperature control systems to ensure that its surface radiation characteristics closely approximate those of an ideal blackbody, thereby guaranteeing a high degree of consistency between the emitted radiation energy and the set temperature. This device is widely utilized in industrial temperature measurement, metrology and calibration, aerospace, and scientific research fields to enhance the accuracy and consistency of infrared measurements. In 2025, projected sales volume stands at 85,000 units, with an average selling price of \$5,245, a total production capacity of 100,000 units, and a gross margin of 38%.
