Abstracts

Radio Over Fiber is a technology that describes the conversion of a Radio Frequency (RF) signal into a Fiber Optic (FO) signal and then back to an RF signal. In Radio Over Fiber architecture, a data-carrying RF (Radio Frequency) signal with a high frequency (usually greater than 10 GHz) is imposed on a lightwave signal before being transported over the optical link. Therefore, wireless signals are optically distributed to base stations directly at high frequencies and converted from the optical to electrical domain at the base stations before being amplified and radiated by an antenna. As a result, no frequency up/down conversion is required at the various base stations, thereby resulting in simple and rather cost-effective implementation is enabled at the base stations.

Scope of the Report:

This report focuses on the Radio Over Fiber in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

Radio over fiber has recently emerged as a useful technology for providing specialized coverage of wireless communications services. It was first proposed and demonstrated by Cooper et al in 1990. This relatively 'niche' market is expected to grow significantly in the future as new radio over fiber technologies emerge and their applications become more diverse and less costly. Radio over fiber is poised to become the dominant access transmission technology for low-power wireless networks.

The industry is relatively concentration, the key brand include Finisar, HUBER + SUHNER, RF Optic, Emcore, APIC Corporation, Syntronics LLC, DEV Systemtechnik, ViaLite, Foxcom, Optical Zonu, Pharad, Fibertower, Intelibs and so on.

The worldwide market for Radio Over Fiber is expected to grow at a CAGR of roughly

11.4% over the next five years, will reach 570 million US\$ in 2023, from 300 million US\$ in 2017, according to a new GIR (Global Info Research) study.
