Abstracts

According to our (Global Info Research) latest study, the global Radioactive Activity Meter market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

A radioactive activity meter, also known as a radiation detector or Geiger-Muller counter, is a device used to measure the level of radioactivity in a given area or object. It detects and measures ionizing radiation, such as alpha particles, beta particles, and gamma rays, emitted by radioactive materials.

The meter consists of a gas-filled tube, typically filled with a low-pressure inert gas, such as argon or helium, and a metal electrode. When ionizing radiation enters the tube, it ionizes the gas atoms, creating a current that can be measured by the meter. The level of current is proportional to the intensity of the radiation.

Radioactive activity meters are commonly used in various fields, including nuclear power plants, medical facilities, environmental monitoring, and research laboratories. They are essential for ensuring safety and compliance with radiation protection regulations.
