According to our (Global Info Research) latest study, the global Radioactive Aerosol Monitor market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Radioactive aerosols refer to tiny particulate matter suspended in the air, which contains radionuclides, such as radioactive particles, aerosolization products of gaseous radionuclides, etc. These radioactive aerosols may come from emissions from nuclear power plants, nuclear accidents, medical radioactive sources, etc.

The Radioactive Aerosol Monitor is a device used to monitor and measure radioactive aerosols in the air. It is mainly used in nuclear power plants, nuclear industry, nuclear medicine, environmental monitoring and emergency response after nuclear accidents. The monitor can provide real-time, accurate radioactive aerosol data to help assess radiation levels in the environment, monitor the operation of nuclear facilities and the environmental radiation situation after a nuclear accident. By monitoring and analyzing radioactive aerosols, the safety of the public and workers can be effectively protected, and necessary measures can be taken in a timely manner to reduce radiation exposure risks.

Currently, the typical models of Radioactive Aerosol Monitor include Thermo Fisher Scientific's FHT 59, Mirion's iCAM, etc.
