## Abstracts

According to our (Global Info Research) latest study, the global Radioactive Glass Microsphere market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Radioactive glass microspheres are a substance used in medical technology. They are usually made of aluminum, silicon oxide and other materials, with a particle size of 20~30 $\mu$ m and a density of 3.3g/mL. These microspheres can be injected into the target tumor tissue through interventional surgery, releasing high-energy pure beta rays to radiate and kill the tumor tissue from the inside.

Radioactive glass microsphere treatment plays an important role in the treatment of liver cancer. It has good results in treating patients with liver cancer in all stages, providing new hope for liver cancer patients. In the future, radioactive glass microspheres will be used more widely.
