Abstracts

The global Radiopharmaceutical Administration Device market size is expected to reach \$ 17.14 million by 2032, rising at a market growth of 12.9% CAGR during the forecast period (2026-2032).

In 2025, global sales of Radiopharmaceutical Administration Device reached approximately 20?35 units, with an average market price of about USD 150000?350000 unit, an annual production capacity of roughly 25?40 units, and an industry-average gross margin of approximately 25%.

A Radiopharmaceutical Administration Device is a shielded automated system designed for the aseptic handling, transfer, inoculation, dispensing and traceable preparation of radiopharmaceutical liquids in production, quality control, sterility testing and nuclear medicine workflows. The system typically integrates lead or tungsten shielding, vial or lead-pot opening mechanisms, precision liquid transfer modules, closed or disposable fluid paths, culture-bottle handling, sealing functions, activity-measurement interfaces, batch-record software and GMP-oriented process controls. It is mainly used for PET, SPECT and therapeutic radionuclide products where operators must manage short half-life materials, radioactive exposure, sterile conditions and dose accuracy within a highly controlled workflow. The core function of the device is to replace manual manipulation of radioactive drug samples with a safer, more standardized and traceable automated process, thereby reducing operator radiation exposure, improving aseptic reliability and supporting consistent radiopharmaceutical dispensing, inoculation and sterility-test sample preparation.
