Rail Climbing Formwork is a modular, self-climbing formwork system that is used for the construction of vertical concrete structures such as walls, cores, and shafts. This system is characterized by the use of rails that are attached to the building, allowing the formwork to climb the structure without the need for cranes or external lifting devices. The climbing process is typically powered by hydraulic jacks, which enable the formwork to ascend smoothly and efficiently as each section of the concrete is poured and cured.
