Abstracts

According to our (Global Info Research) latest study, the global Rail Lubricants market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Rail lubrication is used to minimize friction between the wheel flange and rail interface, especially in curves where side cutting of rails often occurs. Rail lubricators deliver a metered quantity of lubricant from a reservoir to a location on the gauge face of the rail head where it is picked up by wheel flanges of passing vehicles. Rail and wheel wear can be reduced dramatically by proper lubrication, and lubrication can help in saving energy and reducing noise. There are automatic and manual rail lubrication systems
