According to our (Global Info Research) latest study, the global Railway Braking System market size was valued at USD 2669.3 million in 2023 and is forecast to a readjusted size of USD 3766.9 million by 2030 with a CAGR of 5.0% during review period.

Railway Braking System is a system for braking railway rolling stock. Its main function is to control the running speed of railway rolling stock, so that the running train can quickly decelerate, stop, or make it run at a limited speed on the downhill slope. Running to prevent the train from overspeeding due to the gravity of the vehicle when going downhill; even a stationary rolling stock needs to be braked to prevent the parked vehicle from slipping due to gravity or wind blowing.

Railway Braking System is a system for braking railway rolling stock. Its main function is to control the running speed of railway rolling stock, so that the running train can quickly decelerate, stop, or make it run at a limited speed on the downhill slope. Running to prevent the train from overspeeding due to the gravity of the vehicle when going downhill; even a stationary rolling stock needs to be braked to prevent the parked vehicle from slipping due to gravity or wind blowing. Therefore, railway braking is an important link to ensure the safety of railway transportation. If the train cannot rely on braking to control the speed or stop it when it is running at high speed, danger or even serious accidents will inevitably occur. According to their own experience in railway operation and management, railway operators in various countries have strict requirements on the braking distance of trains, which is also the main technical index reflecting the performance of the braking device and the actual braking effect. In terms of product type, type air brake system is the largest segment, occupied for a share of 69.77%, and in terms of application, application freight has a share about 70.72 percent.
