Abstracts

The global Raised Actuator DIP Switch market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Raised Actuator DIP switch is a special type of DIP (Dual Inline Package) switch, and its design feature is that the operating rod protrudes or protrudes above the switch housing.

Key features of the Raised Actuator DIP switch include:

Raised Actuator Lever: Unlike traditional DIP switches or flat lever DIP switches, the Raised Actuator DIP switch has the lever protruding or protruding above the switch housing. This makes the operating lever more obvious in the appearance of the switch, which is convenient for the user to operate.

DIP switch structure: The Raised Actuator DIP switch is still a dual in-line structure with a set of pins that plug into a circuit board hole. They are installed on the circuit board by plug-in and fixed on the circuit board by soldering.

Adjustable Options: Raised Actuator DIP switches typically have multiple switch positions with two or more selectable states on each switch position. By manually operating the raised operating lever, turn the switch to the corresponding state to select circuit options or adjust circuit parameters.

Raised Actuator DIP switch is widely used in electronic equipment for applications such as function selection, parameter configuration, and state switching. They are usually used in communication equipment, computer hardware, household appliances,

industrial control and other fields. Due to its raised operating lever design, the operation is more obvious, and the user can switch the switch state more conveniently, while having a reliable connection and stable performance.
