X-ray lithography, is a process used in electronic industry to selectively remove parts of a thin film. It uses X-rays to transfer a geometric pattern from a mask to a light-sensitive chemical photoresist, or simply 'resist,' on the substrate. A series of chemical treatments then engraves the produced pattern into the material underneath the photoresist. X-ray lithography plays a significant role in the modern semiconductor industry and is being implemented by various industry verticals around the globe. The rising demand for small electronic chips will drive the sales of X-ray lithography equipment during the forecast period.
