Abstracts

Rapid tests are often referred to as point-of-care tests because rather than sending a blood sample to a laboratory, the test can be conducted and the result read in a doctor's office or a community setting, without specialised laboratory equipment. The sample taken is usually either finger-prick blood or saliva.

For people taking a test, the defining feature is that the result can usually be given within 20 or 30 minutes, which is often more convenient and can mean that many more people actually receive their test results.
