## Abstracts

According to our (Global Info Research) latest study, the global Rare Earth-based SCR Catalysts market size was valued at US\$ 810 million in 2025 and is forecast to a readjusted size of US\$ 1138 million by 2032 with a CAGR of 5.0% during review period.

Rare earth-based SCR catalysts are highly efficient and environmentally friendly catalysts that use rare earth element oxides such as lanthanum, cerium, and yttrium as the main active components or additives, combined with transition metals, and supported on titanium-based ceramics. Utilizing the unique electronic structure of rare earth elements, they efficiently convert nitrogen oxides into nitrogen and water in diesel vehicle exhaust and industrial flue gas, exhibiting advantages such as resistance to sulfur poisoning, high temperature resistance, and high activity over a wide temperature window.

Upstream raw materials mainly include rare earth metal salts (cerium nitrate, cerium carbonate, etc.), transition metal oxides (manganese, antimony, tungsten, etc.), and carrier materials. The core of midstream manufacturing lies in the high dispersion technology of active components and porous structure molding processes. Rare earth active sites are uniformly distributed on honeycomb or flat-plate carriers through impregnation, co-precipitation, or sol-gel methods.

Product prices are typically around \$2250 per cubic meter, with global sales estimated at approximately 350,000 cubic meters in 2025, and an industry gross margin of around 30%-40%.
