Abstracts

According to our (Global Info Research) latest study, the global RAS Filter Media market size was valued at US\$ 47.33 million in 2025 and is forecast to a readjusted size of US\$ 89.98 million by 2032 with a CAGR of 9.8% during review period.

Recirculating aquaculture system (RAS) filter media is a functional medium used for biological and mechanical filtration of aquaculture water. Its main function is to remove suspended particles, ammonia nitrogen, and organic pollutants from the water, while providing a habitat for beneficial microorganisms such as nitrifying bacteria, thereby maintaining water quality stability and improving the health of the aquaculture environment. It is widely used in RAS systems for fish, shrimp, shellfish, and other aquaculture, and is a crucial material for achieving high-density aquaculture, reducing water change frequency, and increasing aquaculture yield. In 2024, sales volume was 7,500 tons, with an average price of US\$5,500 per ton, a gross profit margin of 47%, and a single-line production capacity of 500 tons.

In the upstream and downstream supply chain of RAS filter media, upstream focus needs to be on a stable supply of raw materials and environmental compliance. For example, natural minerals such as ceramsite and zeolite must be free of harmful impurities, and quality problems such as pulverization and flaking must be avoided during processing. Downstream, the matching of filter media to the actual application environment of the aquaculture farm is crucial. Different species, densities, and water quality requirements correspond to different combinations of filter media; improper selection may lead to low filtration efficiency or system blockage. In addition, the filter media replacement cycle, microbial culture adaptability, and subsequent maintenance costs are also important factors affecting the end-user experience and system

performance.

The market for filter media in recirculating aquaculture systems is undergoing rapid development driven by both industrial upgrading and environmental protection requirements. On the one hand, with rising environmental standards for aquaculture, increased stocking densities, and the trend towards large-scale and intelligent recirculating aquaculture systems, traditional simple filter media are no longer sufficient to meet the requirements for high-efficiency filtration, biomass load-bearing capacity, and long-term stability, driving rapid growth in demand for high-performance filter media. Especially in large-scale farms, seawater aquaculture, and high-density recirculating systems, new filter media with high specific surface area, excellent biomass adhesion performance, and strong anti-fouling capabilities are gradually replacing traditional filter media, shifting market focus from 'low cost' to 'comprehensive treatment efficiency and system stability.'

From a technological and competitive perspective, the filter media market is evolving towards material functionalization, multi-stage composite filter media, and integrated system solutions. Single physical filtration media are gradually being replaced by composite materials with functions such as biofilm attachment, biofilm support, and ammonia nitrogen removal, driving improvements in filter media performance and added value. Simultaneously, with the integration of recirculating aquaculture systems and intelligent monitoring platforms, filter media, as a key node in the entire recirculating aquaculture ecosystem, is playing an increasingly prominent role in optimizing overall system operating efficiency, maintenance cycles, and operating costs. The future market will focus more on improving filter media performance, its synergy with overall system design, and expanding long-term service and maintenance models, promoting the industry's transformation from 'single filter media sales' to 'filter media + water treatment system solutions.'
