According to our (Global Info Research) latest study, the global Rat Stem Cell Factor market size was valued at US\$ 42.2 million in 2024 and is forecast to a readjusted size of USD 74.7 million by 2031 with a CAGR of 8.3% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Rat stem cell factor (SCF) is a glycoprotein cytokine that holds significant importance in the regulation of various cellular processes within the rat's biological system. It is produced by multiple cell types, including fibroblasts and stromal cells in the bone marrow. Functionally, rat SCF binds to its specific receptor, the c-Kit receptor, which is expressed on the surface of hematopoietic stem cells, mast cells, and other relevant cell populations. Through this interaction, it exerts a variety of effects such as stimulating the proliferation of hematopoietic stem and progenitor cells, promoting their survival, and guiding their differentiation into different blood cell lineages like red blood cells, white blood cells, and platelets. Additionally, rat SCF is involved in the migration of these cells, facilitating their movement to appropriate locations within the body. It also plays a role in the development and maintenance of other cell types, such as melanocytes and germ cells. In research settings, the study of rat SCF provides valuable insights into the mechanisms of hematopoiesis, tissue repair, and development, and it can serve as a model to understand similar processes in other species, including humans, due to the conserved nature of the SCF-c-Kit signaling pathway across different organisms.
