According to our (Global Info Research) latest study, the global Ray Measuring Instrument market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Ray measuring instruments are special equipment used to detect, record and analyze the types, quantities, energy, changes over time and spatial distribution of radiation emitted by radioactive nuclides. These instruments are widely used in nuclear medicine, industrial non-destructive testing, environmental protection, radiation protection and other fields. Ray measuring instruments can accurately detect and measure the intensity and dose rate of various ionizing radiations, including low-level radiation and high-energy radiation. They are also suitable for measuring various types of radiation such as α , β , γ and X-rays to meet the detection needs in different scenarios. Ray measuring instruments usually measure radiation based on different physical principles. For example, the Geiger-Muller counter (GM tube) is used to detect ionizing radiation and generate detection current pulses. Each pulse is detected by the electron tube circuit and recorded as a count. These count values are displayed on the LCD screen, reflecting the intensity or dose rate of the radiation.

With the rapid development of nuclear energy industry, medical industry, environmental monitoring and other fields, the market of radiation metrology instruments has shown a trend of rapid growth. Especially in the field of X-ray detection equipment, affected by

the rapid growth of demand in downstream integrated circuit and electronic manufacturing, new energy batteries and other industries, the market size has maintained a high growth rate. With the continuous advancement of science and technology, radiation metrology instruments have achieved significant improvements in detection accuracy, detection efficiency, and intelligence. For example, digital X-ray detection equipment has gradually replaced traditional detection equipment, and through the combination with intelligent image recognition, big data, AI algorithms and other technologies, the detection process has been automated and intelligent. With the advantage of efficient detection, the penetration rate of online X-ray detection equipment has increased rapidly, especially in the field of new energy battery detection. In summary, the market of radiation metrology instruments has shown a trend of rapid growth. In the future, the market of radiation metrology instruments will usher in a broader development space.
