Abstracts

RDF Pelletizer, also called garbage-derived fuel pelletizer, is a piece of equipment used to process garbage-derived fuel. RDF Pelletizer usually consists of feeding system, compression system, granulation system and discharge system. During the operation, the refuse-derived fuel is first fed into the pelletizer. After a series of processes, including compression, granulation, cooling and other steps, uniform pelletized fuel is finally produced. These pellet fuels have high calorific value and better combustion characteristics, which can effectively replace traditional fossil fuels, while also helping to reduce the negative impact of landfills on the environment.

According to our (Global Info Research) latest study, the global RDF Pelletizer market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
