Reactive Power Compensation Cabinet is a device used to improve the power factor of the power system. In the power system, the power consumed by load equipment includes active power and reactive power. Reactive power is the flow of energy back and forth in an AC circuit, performing no actual power work but causing a reduction in power factor in the system. The reactive power compensation cabinet improves the power factor of the system by compensating the reactive power in the circuit, thereby improving power quality, reducing energy loss, and increasing the working efficiency and life of the equipment.
