Abstracts

According to our (Global Info Research) latest study, the global REBCO Tape Materials market size was valued at US\$ 123 million in 2025 and is forecast to a readjusted size of US\$ 184 million by 2032 with a CAGR of 5.2% during review period.

REBCO tape materials are second-generation high-temperature superconducting coated conductors based on a rare-earth barium copper oxide superconducting layer, commonly expressed as REBa₂Cu₃O_{7-x}, where RE may include yttrium, gadolinium, samarium, or other rare-earth elements. A typical REBCO tape has a multilayer structure consisting of a metallic substrate, buffer layers, a REBCO superconducting layer, a silver protective layer, and copper stabilization layers. These materials offer high critical current density, strong performance under intense magnetic fields, and the potential to operate at temperatures significantly higher than conventional low-temperature superconductors. REBCO tapes are widely considered suitable for high-field magnets, fusion systems, superconducting power cables, fault-current limiters, electric motors, magnetic levitation systems, and advanced scientific equipment. In 2025, global REBCO Tape Materials production reached approximately 4993 km, with an average global marketprice of around 24 USD/m. The production capacity for REBCO Tape Materials in 2025 was approximately 5500 km. The typical gross profit margin for REBCO Tape Materials between 20% and 40%.

The global REBCO tape market is moving from research-oriented and pilot-scale applications toward broader industrial deployment, supported by growing investment in fusion energy, high-field magnets, superconducting power equipment, advanced medical imaging, and high-power-density motors. Demand from fusion developers and research institutions is becoming a major growth driver, while grid modernization,

offshore wind power, electric aviation, and magnetic levitation transportation provide additional long-term opportunities. However, market expansion is still constrained by high production costs, limited long-length uniformity, complex jointing and coil-winding processes, and restricted manufacturing capacity. Future competition will increasingly focus on improving critical current performance, enabling stable long-length production, strengthening mechanical reliability, enhancing coating uniformity, and reducing cost per meter.
