Rebound Hardness Tester, also known as a Durometer or Shore Hardness Tester in some contexts, is an instrument used to measure the hardness of a material by assessing its resilience or ability to rebound after being indented by a standardized indenter. This type of tester typically works on the principle of measuring the height or duration of the rebound of a hammer or plunger after it is dropped or struck against the surface of the material being tested. The hardness value is then calculated based on this rebound measurement and correlated to known hardness standards. Rebound hardness testers are widely used in various industries, such as plastics, rubber, metals, and other materials science applications, to quickly and non-destructively assess the hardness of materials during quality control, research, and development processes.
