Abstracts

According to our (Global Info Research) latest study, the global Receiver Multicoupler market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

A Receiver Multicoupler is used to connect multiple radio receivers to a single antenna. It splits a single input signal that it receives from the antenna into multiple signals with high port-to-port isolation. A typical multicoupler consists of band pass filters, a Low Noise Amplifier and a power divider. It is an important part of a telecommunication system.

There are two types of receiver multicouplers:

Passive Multicouplers: Passive multicouplers always have losses depending on the insertion loss of the filter and power divider used.

Active Multicouplers: Active multicouplers use an LNA at the input to amplify the signal which then compensates for any signal losses after filtration and splitting.
