Abstracts

The global Recloser market size is expected to reach \$ 2077 million by 2032, rising at a market growth of 4.2% CAGR during the forecast period (2026-2032).

A recloser is an automatic switching device used in power transmission and distribution networks. It can automatically reclose and restore power supply after a short-term fault (such as a branch touching a wire, lightning, etc.) without human intervention.

The recloser can be broken down into several segments, Hydraulic Control, Electronic Control, etc. There are two basic types of recloser control schemes: an integral hydraulic control or an electronic control located in a separate cabinet. Hydraulic recloser control is used in most single-phase reclosers and in three-phase recloser types 6H and V6H and is built as an integral part of the recloser. Electronic recloser controls are used in most three-phase reclosers and in the single-phase recloser types VXE, NOVA STS, and NOVA?. Compared with the hydraulic control, electronic controls are more flexible, more easily customized and programmed, and many have advanced protection, metering, and automation functionality.

According to the Segmentation of types, all the market of Recloser can be divided as follows: The first main kind is Hydraulic Control, it hold a comparatively larger share in global market, which accounts for about 55%. Another main kind is Electronic Control, for many companies, Electronic Control is attractive because of the market consumption need in the future. The Electronic Control share the rest 45% market share. From the view of region, Asia-Pacific have a larger market share which account for 40%. North America and Europe hold a market share of 28% and 26%. The Recloser market consists of a well-established group of brand name manufacturers and new entrants. The world leading players in the Recloser market are Eaton, Schneider Electric, ABB

and so on. These Top 3 companies currently account for more than 41% of the total market share.

The power infrastructure in many countries around the world has aged and is in urgent need of replacement. As a key automation device in the distribution system, reclosers are an important part of the upgrade and transformation of the power grid. Especially in the process of power system automation and smart grid development, the application of reclosers will be further expanded. New reclosers are designed with more emphasis on durability and high reliability, and can adapt to extreme environments and complex grid conditions. These devices use advanced materials and technologies to ensure normal operation under harsh climatic conditions. In the future, with the continuous promotion of smart grids, the demand for smart reclosers will further increase. Reclosers with automatic fault isolation, remote control and data acquisition capabilities will become an important part of the power system.
