## Abstracts

According to our (Global Info Research) latest study, the global Recombinant Antihemophilic Globulin market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The recombinant antihemophilic globulin is a drug synthesized by gene recombination technology, which is used to treat patients with hemophilia A. Hemophilia A is an inherited bleeding disorder caused by deficiency or dysfunction of clotting factor VIII.

The recombinant antihemophilic globulin is a synthetic form of factor VIII that functions similarly to the human-produced clotting factor VIII. It helps hemophilia A patients restore normal coagulation function and prevent or treat bleeding episodes by supplementing deficient coagulation factor VIII. The preparation process of the recombinant antihemophilic globulin includes the following steps: gene cloning, expression vector construction, cell culture and expression, purification and preparation. It has the characteristics of high efficiency, safety and stability, can effectively control and prevent bleeding, and improve the quality of life of hemophilia patients.

The Global Info Research report includes an overview of the development of the Recombinant Antihemophilic Globulin industry chain, the market status of Clinical Treatment (Baikoc, Afstyla), Drug Research (Baikoc, Afstyla), and key enterprises in developed and developing market, and analysed the cutting-edge technology, patent, hot applications and market trends of Recombinant Antihemophilic Globulin.
