## Abstracts

The global Recombinant Antihemophilic Globulin market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The recombinant antihemophilic globulin is a synthetic form of factor VIII that functions similarly to the human-produced clotting factor VIII. It helps hemophilia A patients restore normal coagulation function and prevent or treat bleeding episodes by supplementing deficient coagulation factor VIII. The preparation process of the recombinant antihemophilic globulin includes the following steps: gene cloning, expression vector construction, cell culture and expression, purification and preparation. It has the characteristics of high efficiency, safety and stability, can effectively control and prevent bleeding, and improve the quality of life of hemophilia patients.

The recombinant antihemophilic globulin is a drug synthesized by gene recombination technology, which is used to treat patients with hemophilia A. Hemophilia A is an inherited bleeding disorder caused by deficiency or dysfunction of clotting factor VIII.

This report studies the global Recombinant Antihemophilic Globulin production, demand, key manufacturers, and key regions.
