The global Recombinant Human Erythropoietin for Injection market size is expected to reach \$ 14120 million by 2029, rising at a market growth of 5.9% CAGR during the forecast period (2023-2029).

Recombinant Human Erythropoietin for Injection is a crucial biopharmaceutical product used in the treatment of anemia, with a substantial and continually growing market size. The ongoing aging of the population and the rise in chronic disease patients have maintained a steady demand for erythropoietin. Furthermore, the continuous advancement in biopharmaceutical technology is expected to enhance product efficacy and convenience, expanding potential market applications, including the treatment of kidney disease and cancer patients, offering more opportunities for future development.

Erythropoietin is produced by interstitial fibroblasts in the kidney in close association with peritubular capillary and proximal convoluted tubule. It is also produced in perisinusoidal cells in the liver. While liver production predominates in the fetal and perinatal period, renal production is predominant during adulthood.
