Mussel adhesive protein, also known as 'soft gold of the ocean', was first discovered in the 1980s and belongs to the marine polyphenol protein family. The structural sequence of mussel adhesive protein is rich in lysine (Lys), arginine (Arg) and tyrosine (Tyr), which makes it have a strong positive charge at the physiological pH value of the human body. At the same time, it can form a large number of DOPA groups after being oxidized by tyrosinase. These physical and chemical properties give mussel adhesive protein a unique cell repair function. It can not only control the arrangement of cell repair in the wound area, thereby reducing scars, but also effectively adhere to the wound surface, play an isolating, moisturizing and anti-inflammatory effect, and promote the repair of skin damage caused by oxidation, ultraviolet radiation, allergies, etc.
