## Abstracts

The global Recombinant Protein Expression and Purification market size is expected to reach \$ 2423 million by 2032, rising at a market growth of 5.0% CAGR during the forecast period (2026-2032).

Recombinant Protein Expression and Purification refers to a core two-step biotechnological process: first, using genetically engineered host systems (microbial, mammalian, insect, etc.) to synthesize target proteins encoded by recombinant DNA, and second, applying separation and refinement techniques (chromatography, filtration, precipitation, etc.) to isolate the target protein from crude cell lysates or culture supernatants, removing impurities (endotoxins, host cell proteins, nucleic acids) to achieve specified purity, activity, and stability for research, diagnostic, or therapeutic use.

Key trends include the adoption of automated and integrated bioprocessing platforms, single-use technologies for flexibility and contamination control, AI-driven sequence optimization for difficult-to-express proteins, and miniaturization for high-throughput screening; opportunities stem from surging demand for biotherapeutics, antibody drugs, vaccine antigens, and cell/gene therapy, as well as outsourcing of technical processes by biotech and pharma firms; major challenges involve technical bottlenecks in folding complex/membrane proteins, ensuring batch-to-batch consistency, reducing production costs (especially for mammalian expression), meeting strict regulatory requirements for clinical-grade products, and scaling up lab-scale processes to commercial volumes.

This report studies the global Recombinant Protein Expression and Purification demand, key companies, and key regions.
