According to our (Global Info Research) latest study, the global Recombinant Rabbit Monoclonal Antibodies market size was valued at US\$ 2288 million in 2024 and is forecast to a readjusted size of USD 3054 million by 2031 with a CAGR of 4.2% during review period.

Recombinant rabbit monoclonal antibodies are a cutting - edge class of antibodies that are produced through recombinant DNA technology. These antibodies are derived from rabbits and offer several advantages. They are highly specific, precisely targeting a single antigenic determinant, which allows for accurate detection and binding in various applications such as immunohistochemistry, flow cytometry, and immunoassays. The recombinant production process involves the cloning and expression of antibody genes in host cells, enabling the generation of antibodies with consistent quality and properties. They have a wide range of uses in biomedical research, including the study of disease mechanisms, biomarker discovery, and the development of diagnostic tools. In therapeutics, they hold great potential as well, for example, in cancer treatment and autoimmune disease management, where their ability to selectively bind to disease - related antigens can be harnessed to either trigger an immune response against the target cells or block harmful interactions.
