Abstracts

Therapeutic proteins are engineered in the laboratory for pharmaceutical use, including non-covalent binders. These proteins are highly effective and serve as modernized treatment for rare as well as chronic diseases. Protein therapeutics offer custom-made treatment approach by supporting a specifically targeted therapeutic process by compensating the deficiency of an essential protein. Recombinant proteins have gained significant traction for therapeutic applications and the number of proteins either launched or approved into clinical trials has continually increased over the past two decades. According to the National Center for Biotechnology Information (NCBI) data of 2017, the U.S. Food and Drug Administration (FDA) approved over 140 recombinant therapeutic proteins for human use and several hundred are currently in development. Majority of these proteins are recombinant monoclonal antibodies.
