## Abstracts

According to our (Global Info Research) latest study, the global Recombinant Therapeutic Protein market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Recombinant Therapeutic Protein are produced by using a technique called recombinant DNA or recombinant RNA to produce proteins. The method can be divided into in vitro method and in vivo method. Both approaches are premised on the use of genetic recombination techniques to obtain recombinant vectors attached to gene fragments that can be translated into target proteins and then transferred to host cells that can express target proteins to express specific recombinant governance protein molecules.

The global pharmaceutical market is 1475 billion USD in 2022, growing at a CAGR of 5% during the next six years. The pharmaceutical market includes chemical drugs and biological drugs. For biologics is expected to 381 billion USD in 2022. In comparison, the chemical drug market is estimated to increase from 1005 billion in 2018 to 1094 billion U.S. dollars in 2022. The pharmaceutical market factors such as increasing demand for healthcare, technological advancements, and the rising prevalence of chronic diseases, increase in funding from private & government organizations for development of pharmaceutical manufacturing segments and rise in R&D activities for drugs. However, the industry also faces challenges such as stringent regulations, high costs of research and development, and patent expirations. Companies need to continuously innovate and adapt to these challenges to stay competitive in the market and ensure their products reach patients in need. Additionally, the COVID-19 pandemic has highlighted the importance of vaccine development and supply chain management,

further emphasizing the need for pharmaceutical companies to be agile and responsive to emerging public health needs.
