Abstracts

The global Recycled PMMA market size is expected to reach $ 889 million by 2032, rising at a market growth of 7.8% CAGR during the forecast period (2026-2032).

Recycled PMMA (Recycled Polymethyl Methacrylate) refers to PMMA materials recovered and reprocessed from waste PMMA products through mechanical recycling, chemical recycling, or other advanced recycling technologies. The raw materials mainly come from Post-Industrial Recycled (PIR) sources, including PMMA sheet cutting waste, injection molding scrap, extrusion waste, and production rejects, as well as Post-Consumer Recycled (PCR) sources such as discarded automotive taillights, advertising boards, architectural materials, and consumer products. Depending on the recycling process and purity level, Recycled PMMA can be converted into PMMA pellets, PMMA sheets, PMMA films, and other functional PMMA products. High-quality recycled PMMA produced through chemical depolymerization can recover PMMA back into MMA monomer and regenerate PMMA with performance close to virgin material, offering high transparency, low impurity levels, and strong circularity value. Recycled PMMA plays an important role in sustainable material solutions for automotive, construction, display, optical, electronics, and other advanced applications.

In 2025, the global production of Recycled PMMA reached 100,000 tons, with a unit price of US$5,000 per ton and a gross margin of 30%.
