## Abstracts

According to our (Global Info Research) latest study, the global Redundant Array of Independent Disks (RAID) market size was valued at USD 5618.1 million in 2023 and is forecast to a readjusted size of USD 8304.6 million by 2030 with a CAGR of 5.7% during review period.

RAID (originally redundant array of inexpensive disks, now commonly array of independent disks) is a data storage virtualization technology that combines multiple physical disk drive components into a single logical unit for the purposes of data redundancy, performance improvement, or both.

Data is distributed across the drives in one of several ways, referred to as RAID levels, depending on the required level of redundancy and performance. The different schemas, or data distribution layouts, are named by the word RAID followed by a number, for example RAID 0 or RAID 1. Each schema, or RAID level, provides a different balance among the key goals: reliability, availability, performance, and capacity. RAID levels greater than RAID 0 provide protection against unrecoverable sector read errors, as well as against failures of whole physical drives.

The major players in global Redundant Array of Independent Disks (RAID) market include Broadcom(Avago Technologies), Intel, Dell, etc. The top 3 players occupy about 50% shares of the global market.
