A Reed Contact Cylinder Sensor is a type of non-contact proximity sensor that utilizes a reed switch housed within a cylindrical casing to detect the presence or movement of magnetic objects. The reed switch consists of two ferromagnetic blades hermetically sealed inside a glass tube; these blades come into contact and complete an electrical circuit when exposed to a magnetic field. Typically used in pneumatic cylinders or automation equipment, the sensor detects the position of a piston that contains a magnet. When the piston moves and its magnetic field approaches the sensor, the reed switch activates, sending a signal to the control system. Reed contact cylinder sensors are valued for their reliability, long operational life, and resistance to dirt, dust, and moisture, making them suitable for harsh industrial environments.
