Abstracts

A catalyst can be defined as a component that accelerates a chemical reaction without taking part in the process. The amount of catalyst required is small compared to the amount of reactants. In most cases, the entire quantity of catalyst is recovered at the end of the reaction process. In refining, catalysts play an important role in cracking heavy carbon chains into lighter products such as diesel and gasoline. Hence, these are mostly used in processes subsequent to the post atmospheric and vacuum distillation units.

Scope of the Report:

This report focuses on the Refinery Catalyst in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa.
