Abstracts

The global Refrigerated Transport Vehicles market size is expected to reach \$ 31145 million by 2032, rising at a market growth of 4.8% CAGR during the forecast period (2026-2032).

In 2025, global Refrigerated Transport Vehicles production reached approximately 0.404 M Units. The average price is approximately \$54,000. Refrigerated Transport Vehicles are road-going vehicles specifically engineered to transport temperature-sensitive goods by maintaining a controlled thermal environment throughout transit. They integrate a thermally insulated cargo body with an active refrigeration system (and monitoring controls) to keep cargo within defined temperature ranges—typically chilled (0°8 °C), frozen (-18 °C), or multi-temperature zones—regardless of ambient conditions.

Gross Profit Margin Levels

The gross profit margin of refrigerated transport vehicles exhibits a tiered structure of 'chassis scaling vs. body/trailer engineering': Chassis OEMs (especially heavy/light truck platforms) in the commercial vehicle industry are typically affected by cyclical and price competition, with gross profit margins more dependent on scale and supply chain; while refrigerated bodies/refrigerated semi-trailers are more engineering-oriented products, with value concentrated in insulation structure, sealing and durability, lightweight materials, temperature control and compliance certifications (such as food and pharmaceutical temperature control). Therefore, high-specification projects (multi-temperature zones, pharmaceutical grade, with remote temperature control and traceability) often command higher premiums. Generally, it can be understood in three tiers: economy/regional OEMs (approximately 15%–22%), mainstream brands and large-scale trailer manufacturers (approximately 18%–28%), and high-specification customization and 'vehicle + body + digitalization' solutions (approximately 25%–35%+). The real difference lies not in the cost of a single material, but in reliability reputation,

fleet's large customer channels, after-sales network, and total cost of ownership (TCO) delivery capabilities.

Industry Drivers

The growth of refrigerated transport vehicles is driven by three converging forces: First, the continued increase in fresh/frozen food consumption and e-commerce has led to a demand for high-frequency, short-stop, and multi-door cold chain transportation capacity in urban distribution. Second, increasingly stringent food safety and pharmaceutical cold chain compliance has made fleets more willing to invest in traceable and auditable temperature control equipment and onboard data. Third, environmental protection and policies are driving the industry to shift from 'diesel refrigeration + high GWP refrigerant' to low GWP refrigerant, fleet electrification, and electric refrigeration platforms (with regulations and low-emission policies in some regions driving this faster), resulting in shorter replacement cycles and structural upgrades. Public research also lists e-commerce fresh food fulfillment, food safety requirements, electric refrigeration platforms, and regulations such as CARB and European F-gas as important factors driving the upgrading and replacement of refrigerated trailers.

This report studies the global Refrigerated Transport Vehicles production, demand, key manufacturers, and key regions.
