Abstracts

The global Regenerative Oxidation Incinerator market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The regenerative oxidation incinerator has the characteristics of high thermal efficiency, reliable operation, and the ability to process low-to-medium concentration waste gas. The principle is to heat the organic waste gas to above 760°C, so that the organic matter in the waste gas is oxidized and decomposed into CO₂ and H₂O in the oxidation chamber. It is a low-concentration organic waste gas treatment equipment with low energy consumption and high removal rate. Compared with the traditional catalytic combustion (CO) and direct-fired thermal oxidation furnace (TO), it has the characteristics of high thermal efficiency (?95%), low operating cost, and can adapt to complex working conditions. When the concentration of exhaust gas is high, it can also Carry out secondary waste heat recovery, reduce production and operation costs, and realize economic value.
