The relaxation screen is a vibrating screening device that uses the principle of alternating tension and relaxation of the screen to perform efficient screening. It uses an elastic screen surface to produce rapid relaxation vibration under the action of the exciting force, so that the material jumps on the screen surface at a high frequency, thereby achieving effective classification and separation of fine, highly viscous, wet or difficult-to-screen materials. The equipment has the characteristics of high screening efficiency, low clogging, and strong self-cleaning ability. It is widely used in material classification and processing in coal, mining, chemical, building materials and other industries.
