According to our (Global Info Research) latest study, the global Reluctance Switch market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Reluctance Switch is an electronic switch that works based on the magnetoresistance effect. It consists of a magnetoresistive element and a control circuit. The magnetoresistive element is usually a magneto-resistive or magneto-resistive sensor whose resistance changes in response to changes in the surrounding magnetic field. The control circuit realizes the control of the switch by detecting the resistance change of the magnetoresistive element. When a magnetic field acts on the magnetoresistive element, its resistance value will change. The control circuit can determine whether there is a magnetic field by detecting the change of the resistance value, and convert it into a control signal of the switch state. The magnetoresistive switch has fast response speed, simple structure, high sensitivity, high stability, low power consumption, etc., and can be used in various applications.
