Abstracts

The global Remote Control Racing Car market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

RC racing car is a miniature model car, van, bus, truck or off-road vehicle that can be controlled from a distance with a dedicated transmitter or remote control. The term 'RC' for remote control racing was once used to mean 'remote control' and 'radio controlled', but the latter is now obsolete. These days, the term 'RC' usually refers only to vehicles that are controlled by radio.

Remote control racing cars have a variety of power sources. Electric models are powered by small but powerful electric motors and rechargeable NiCad, NiMH or Lithium Polymer batteries. There are also brushed or brushless motors - brushless motors are more powerful and efficient, but also significantly more expensive than brushed motors. Most gasoline-powered models use a glow-plug engine, a small internal combustion engine powered by a special mixture of nitromethane, methanol, and oil (in most cases castor oil and synthetic oil) mixture). These are called 'nitro' cars. More recently, some very large models have been introduced that are powered by small gasoline engines, similar to lawn mower engines, which use a mixture of oil and gasoline. Electric vehicles are often considered easier to operate than gasoline-powered vehicles, but can be just as complex at higher budgets and skill levels. Within both categories of vehicles, there are both on-road and off-road vehicles to choose from. Off-road vehicles have fully functional off-road suspension and a wide choice of tires for use on all types of terrain. Road vehicles, where the suspension is less firm and limited to flat, paved surfaces. There are also rally cars, which are somewhere between on-road and off-road, and are driven on gravel, dirt, or other loose surfaces.
