Remote Telecontrol Units are microprocessor-controlled electronic device that interfaces objects in the physical world to a distributed control system or SCADA (supervisory control and data acquisition) system by transmitting telemetry data to a master system, and by using messages from the master supervisory system to control connected objects.

RTU's remote monitoring functions can be used for Oil and gas (offshore platforms, onshore oil wells, pump stations on pipelines), Networks of pump stations (waste water collection, or for water supply), Environmental monitoring systems (pollution, air quality, emissions monitoring), Mine sites and Air traffic equipment such as navigation aids (DVOR, DME, ILS and GP). RTU's remote monitoring and control functions can be used for Hydro-graphic (water supply, reservoirs, sewage systems), Electrical power transmission networks and associated equipment, Natural gas networks and associated equipment, Outdoor warning sirens and The Biosphere II project, etc.
