Abstracts

The global Remote Tower Solution market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Remote towers can operate both single airports and multiple airports simultaneously from a remote location. This saves costs on civilian infrastructure and ATM systems. The aviation industry is undergoing a digital transformation. Digital MRO, autonomous aircraft and drones, and digital airport technologies, among others, are driving the industry toward digitalization. Remote towers are at the forefront of digitization at airports. They replace the human OTW view with a digital device operating using a highly automated system. In addition to the digital display, the aerial data received by the remote tower and the automatic algorithms that create the terrain map and collision avoidance map for the controller are also digital. With air traffic control services making up a significant portion of an airport's cost base and EU regulatory changes prohibiting subsidies, remote tower services (RTS) could become a lifeline for many smaller airports in Europe. They will also be a key enabler of truly smart airports, which will significantly improve costs and service quality.

A remote tower enables Air Traffic Control services to be provided at an airport from a remote location, instead of from the conventional ATC tower situated at the airport. The services are provided using innovative technology: high resolution cameras, microphones, sensors and a local processing system. The Remote Tower Centre is fitted with screens and hardware controls to enable the air traffic controller to provide the same ATC services as if seated in the conventional tower. It enables consolidation of several airports' operations into a single Remote Tower Centre.
